Maximum Match 100%
Listing first 89 summaries

Database : pubnewdb:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 368; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Example 8; Col 57-58; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The repeats, when
CC   analysed, fall into 4 categories: 1) perfect repeats which are
CC   alternating tandem CA repeats with no interruptions and without adjacent
CC   repeats of another sequence; 2) imperfect repeats which are defined as 2
CC   or more runs of uninterrupted CA repeats separated by no more than 3
CC   consecutive non-repeat bases; 3) compound perfect repeats which are
CC   uninterrupted runs of CA separated by no more than 3 consecutive non-
CC   repeat bases from a run of at least 5 uninterrupted dinucleotide or
CC   longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at
CC   least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats
CC   which are defined as for the perfect compound repeats except that the
CC   runs of CA are interrupted. The sequence presented here is an example of
CC   a perfect repeat sequence of structure: (CA)20. (Updated on 25-MAR-2003
CC   to correct PF field.)

XX
PS   Disclosure; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf23 which contains the repeat sequence having the
CC   formula: (AC)20. (Updated on 25-MAR-2003 to correct PF field.)

PT   New simple sequence repeats having 2 or more tandemly repeated nucleotide
PT   core elements isolated from ryegrass and fescue, useful for selecting of
PT   genes in grass or cereal breeding or profiling grass or cereal species
PT   varieties.
XX
PS   Claim 13; Page 53; 72pp; English.
XX
CC   The invention relates to a substantially purified or isolated nucleic
CC   acid (I) from ryegrass or fescue species including a simple sequence
CC   repeat (SSR), having 2 or more tandemly repeated nucleotide core elements
CC   2-6 nucleotides in length. Also included are a nucleic acid primer
CC   suitable for amplifying an SSR, identifying (M1) an SSR by preparing a
CC   library of ryegrass or fescue genomic DNA enriched for SSRs and
CC   identifying clones in the library containing SSRs, a library of ryegrass
CC   or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for
CC   a gene in grass or cereal breeding by identifying an SSR that is closely
CC   associated with the gene such that the SSR and the gene are
CC   preferentially co-inherited, and selecting for the SSR in the breeding, a
CC   method for DNA profiling grass or cereal species varieties by assessing
CC   variation between SSR varieties and testing the purity of grass or cereal
CC   seed batches by assessing variation within seed batch of an SSR. The SSRs
CC   may be used in the selection of genes in grass or cereal breeding, for
CC   profiling grass or cereal species varieties, for testing the purity of
CC   grass or cereal seed batches, and for DNA profiling to establish the
CC   distinct identity, uniformity and/or stability of a cultivar. The present
CC   sequence is a ryegrass or fescue SSR

PT   Detecting a nucleotide repeat region in a nucleic acid having a
PT   particular length, useful for identifying nucleotide length polymorphism
PT   associated with a neurodegenerative disease, comprises using a ligase-
PT   assisted spacer addition assay.
XX
PS   Example 10; Page 55; 89pp; English.
XX
CC   The invention relates to a method of identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length, comprising employing ligase-assisted spacer addition
CC   (LASA) assay. The method is useful in the identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length. In particular, the method is useful for identification
CC   of a nucleotide length polymorphism in animals or humans, which is
CC   associated with a neurodegenerative disease including fragile X syndrome,
CC   Huntington's disease, or muscular dystrophy. Furthermore, the method may
CC   be used for identifying and/or typing microorganisms including yeasts and
CC   lower uni- and multi-cellular organisms, as well as prokaryotic
CC   microorganisms; and for genotyping subjects including humans. The method
CC   is also useful for detecting certain cancers and other malignancies.
CC   Moreover, the method can be used to provide markers for use in
CC   identification of human and non-human individuals, plants and
CC   microorganisms, to ascertain parentage of human or non-human individual,
CC   and to monitor responses to therapies including the possibility of
CC   nucleic acid damage. The nucleotide polymorphisms may be used in forensic
CC   science to identify a particular victim or an alleged perpetrator of a
CC   crime, in gene mapping and population studies. LASA may also be used in
CC   the manufacture of a kit for detecting and/or identifying nucleotide
CC   repeat regions such as a nucleotide length polymorphism in a eukaryotic
CC   genome. The LASA method avoids the time and cost required by prior art
CC   methods using gel electrophoresis and Southern transfer analysis. In
CC   particular, current diagnosis of Huntington's disease relies heavily upon
CC   the use of gel electrophoresis, a process that has proved difficult to
CC   automate or miniaturise. The LASA method allows total avoidance of this
CC   limiting step, making it a strong candidate for future use in clinical
CC   and laboratory procedures. ABK24276-ABK24313 represent primers used to
CC   detect polymorphisms or microsatellites as described in the method of the
CC   invention

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf29 which contains the repeat sequence having the
CC   formula: (AC)19.5. (Updated on 25-MAR-2003 to correct PF field.)

XX
CC   The invention relates to a kit for diagnosing and treating T-cell
CC   associated diseases which comprises a panel of nucleic acid primers
CC   specifically priming and allowing amplification of each Vbeta gene,
CC   VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC   rejection and diagnosing and treating T-cell associated diseases
CC   including autoimmune diseases, degenerative nervous system diseases,
CC   graft versus host disease, hypersensitivity diseases, infectious diseases
CC   and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC   atrophic gastritis. Degenerative nervous system diseases include multiple
CC   sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC   I hypersensitivities such as contact with allergens that lead to
CC   allergies, Type II hypersensitivities such as those present in
CC   Goodpasture's syndrome and Type IV hypersensitivities such as those
CC   manifested in leprosy. Infectious diseases include viral infections
CC   caused by viruses such as HIV, fungal infections such as those caused by
CC   the yeast genus Candida, parasitic infections such as those caused by
CC   schistosomes, filaria and bacterial infections such as those caused by
CC   Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC   such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC   breast. The present sequence represents a Vbeta gene repeat sequence.

CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The repeats, when
CC   analysed, fall into 4 categories: 1) perfect repeats which are
CC   alternating tandem CA repeats with no interruptions and without adjacent
CC   repeats of another sequence; 2) imperfect repeats which are defined as 2
CC   or more runs of uninterrupted CA repeats separated by no more than 3
CC   consecutive non-repeat bases; 3) compound perfect repeats which are
CC   uninterrupted runs of CA separated by no more than 3 consecutive non-
CC   repeat bases from a run of at least 5 uninterrupted dinucleotide or
CC   longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at
CC   least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats
CC   which are defined as for the perfect compound repeats except that the
CC   runs of CA are interrupted. The sequence presented here is an example of
CC   a perfect repeat sequence of structure: (AC)19. (Updated on 25-MAR-2003
CC   to correct PF field.)

PT   Selecting a domestic animal for having desired genotypic properties
PT   comprises testing the animal for the presence of a parentally imprinted
PT   quantitative trait locus which is related to muscle mass and/or fat
PT   deposition.
XX
PS   Example 4; Fig 10; 107pp; English.
XX
CC   The present invention describes a method (M1) for selecting a domestic
CC   animal for having desired genotypic properties. The method comprises
CC   testing the animal for the presence of a parentally imprinted
CC   quantitative trait locus (QTL). The pig QTL is located at chromosome 2,
CC   mapping at around position 2p1.7. Also described are: (1) an isolated
CC   and/or recombinant nucleic acid (N1) comprising a parentally imprinted
CC   QTL or its functional fragment; (2) an isolated and/or recombinant
CC   nucleic acid (N2) comprising a synthetic parentally imprinted QTL derived
CC   from at least one chromosome or its functional fragment; (3) an animal
CC   such as pig selected for having desired genotypic or potential phenotypic
CC   properties; (4) a transgenic animal comprising N1 or N2; and (5) sperm or
CC   an embryo derived from the animal of (3) or (4). N1 or its fragment is
CC   useful for selecting an animal destined for slaughter or a breeding
CC   animal having desired genotypic or potential phenotypic properties. The
CC   properties are related to muscle mass and/or fat deposition. The sperm or
CC   an embryo are useful in breeding animals destined for slaughter. The
CC   present sequence represents a microsatellite oligonucleotide, which is
CC   given in an example from the present invention for the identification of
CC   DNA sequence polymorphisms in the IGF2 (insulin-like growth factor 2) and
CC   flanking loci

XX
PT   Detecting a nucleotide repeat region in a nucleic acid having a
PT   particular length, useful for identifying nucleotide length polymorphism
PT   associated with a neurodegenerative disease, comprises using a ligase-
PT   assisted spacer addition assay.
XX
PS   Example 10; Page 55; 89pp; English.
XX
CC   The invention relates to a method of identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length, comprising employing ligase-assisted spacer addition
CC   (LASA) assay. The method is useful in the identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length. In particular, the method is useful for identification
CC   of a nucleotide length polymorphism in animals or humans, which is
CC   associated with a neurodegenerative disease including fragile X syndrome,
CC   Huntington's disease, or muscular dystrophy. Furthermore, the method may
CC   be used for identifying and/or typing microorganisms including yeasts and
CC   lower uni- and multi-cellular organisms, as well as prokaryotic
CC   microorganisms; and for genotyping subjects including humans. The method
CC   is also useful for detecting certain cancers and other malignancies.
CC   Moreover, the method can be used to provide markers for use in
CC   identification of human and non-human individuals, plants and
CC   microorganisms, to ascertain parentage of human or non-human individual,
CC   and to monitor responses to therapies including the possibility of
CC   nucleic acid damage. The nucleotide polymorphisms may be used in forensic
CC   science to identify a particular victim or an alleged perpetrator of a
CC   crime, in gene mapping and population studies. LASA may also be used in
CC   the manufacture of a kit for detecting and/or identifying nucleotide
CC   repeat regions such as a nucleotide length polymorphism in a eukaryotic
CC   genome. The LASA method avoids the time and cost required by prior art
CC   methods using gel electrophoresis and Southern transfer analysis. In
CC   particular, current diagnosis of Huntington's disease relies heavily upon
CC   the use of gel electrophoresis, a process that has proved difficult to
CC   automate or miniaturise. The LASA method allows total avoidance of this
```

```
CC   limiting step, making it a strong candidate for future use in clinical
CC   and laboratory procedures. ABK24276-ABK24313 represent primers used to
CC   detect polymorphisms or microsatellites as described in the method of the
CC   invention

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf12 which contains the repeat sequence having the
CC   formula: (AC)11AT(AC)8A. (Updated on 25-MAR-2003 to correct PF field.)

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 347; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 289; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf30 which contains the repeat sequence having the
CC   formula: (AC)18.5. (Updated on 25-MAR-2003 to correct PF field.)

XX
PT   Isolation of satellite sequences from genomic DNA for use as DNA markers
PT   comprises isolating a library with high homogeneity by DNA fragmentation.
XX
PS   Example 5; Page 14; 35pp; Japanese.
XX
CC   The invention provides a novel method for isolation of satellite
CC   sequences from genomic DNA that comprises fragmentation of the DNA by a
CC   method which is not dependent on base sequences, then selection of the
CC   satellite sequences from the obtained genomic library of high
CC   homogeneity. The method is useful for the isolation of microsatellite DNA
CC   sequences which can be used as DNA markers. The new method markedly
CC   improves the efficiency of isolation of satellite sequences in comparison
CC   to prior art methods which are reliant on base sequences. Sequences
CC   AAZ98483-514 represent sequences from Haliotis discus, used in the method
CC   of the invention

XX
PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 292; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 13-14; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf113 which contains the repeat sequence having the
CC   formula: (AC)18. (Updated on 25-MAR-2003 to correct PF field.)

PT   New simple sequence repeats having 2 or more tandemly repeated nucleotide
PT   core elements isolated from ryegrass and fescue, useful for selecting of
PT   genes in grass or cereal breeding or profiling grass or cereal species
PT   varieties.
XX
PS   Claim 6; Page 51; 72pp; English.
XX
CC   The invention relates to a substantially purified or isolated nucleic
CC   acid (I) from ryegrass or fescue species including a simple sequence
CC   repeat (SSR), having 2 or more tandemly repeated nucleotide core elements
CC   2-6 nucleotides in length. Also included are a nucleic acid primer
CC   suitable for amplifying an SSR, identifying (M1) an SSR by preparing a
CC   library of ryegrass or fescue genomic DNA enriched for SSRs and
CC   identifying clones in the library containing SSRs, a library of ryegrass
CC   or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for
CC   a gene in grass or cereal breeding by identifying an SSR that is closely
CC   associated with the gene such that the SSR and the gene are
CC   preferentially co-inherited, and selecting for the SSR in the breeding, a
CC   method for DNA profiling grass or cereal species varieties by assessing
CC   variation between SSR varieties and testing the purity of grass or cereal
CC   seed batches by assessing variation within seed batch of an SSR. The SSRs
CC   may be used in the selection of genes in grass or cereal breeding, for
CC   profiling grass or cereal species varieties, for testing the purity of
CC   grass or cereal seed batches, and for DNA profiling to establish the
CC   distinct identity, uniformity and/or stability of a cultivar. The present
CC   sequence is a ryegrass or fescue SSR

PT   Detecting a nucleotide repeat region in a nucleic acid having a
PT   particular length, useful for identifying nucleotide length polymorphism
PT   associated with a neurodegenerative disease, comprises using a ligase-
PT   assisted spacer addition assay.
XX
PS   Example 10; Page 55; 89pp; English.
XX
CC   The invention relates to a method of identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length, comprising employing ligase-assisted spacer addition
CC   (LASA) assay. The method is useful in the identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length. In particular, the method is useful for identification
CC   of a nucleotide length polymorphism in animals or humans, which is
CC   associated with a neurodegenerative disease including fragile X syndrome,
CC   Huntington's disease, or muscular dystrophy. Furthermore, the method may
CC   be used for identifying and/or typing microorganisms including yeasts and
CC   lower uni- and multi-cellular organisms, as well as prokaryotic
CC   microorganisms; and for genotyping subjects including humans. The method
CC   is also useful for detecting certain cancers and other malignancies.
CC   Moreover, the method can be used to provide markers for use in
CC   identification of human and non-human individuals, plants and
CC   microorganisms, to ascertain parentage of human or non-human individual,
CC   and to monitor responses to therapies including the possibility of
CC   nucleic acid damage. The nucleotide polymorphisms may be used in forensic
CC   science to identify a particular victim or an alleged perpetrator of a
CC   crime, in gene mapping and population studies. LASA may also be used in
CC   the manufacture of a kit for detecting and/or identifying nucleotide
CC   repeat regions such as a nucleotide length polymorphism in a eukaryotic
CC   genome. The LASA method avoids the time and cost required by prior art
CC   methods using gel electrophoresis and Southern transfer analysis. In
CC   particular, current diagnosis of Huntington's disease relies heavily upon
CC   the use of gel electrophoresis, a process that has proved difficult to
CC   automate or miniaturise. The LASA method allows total avoidance of this
CC   limiting step, making it a strong candidate for future use in clinical
CC   and laboratory procedures. ABK24276-ABK24313 represent primers used to
CC   detect polymorphisms or microsatellites as described in the method of the
CC   invention

PT   Typing genes that contain polymorphic microsatellite loci, useful for
PT   identifying predisposition to disease, by amplification and determining
PT   length of amplicons.
XX
PS   Claim 9; Page 50; 64pp; German.
XX
CC   The invention describes a method of typing (M1) a gene (I) that has one
CC   or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC   amplification of at least one DNA region of (I) that includes PML, using
CC   as template a DNA sample containing at least one segment of (I); and
CC   determining the length of the resulting amplicon(s). Also described are:
CC   a method of determining (M2) microsatellite markers (MM) for
CC   predisposition to a disease, associated with a gene that includes one or
CC   more PML; and prediagnosis (M3) of diseases associated with gene that
CC   include PML. The method is used to identify microsatellite markers, in a
CC   disease-related gene, that are associated with a predisposition to
CC   diseases and for prediagnosis of such diseases, especially prion diseases
CC   but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC   metabolic diseases; also to type genes that encode milk proteins,
CC   hormones or transcription factors. The method is simpler, quicker and
CC   particularly less expensive than known methods based on sequencing. This
CC   sequence represents a prion protein polymorphic microsatellite marker
CC   consensus sequence.

PT   Selecting highly-dormant wheat using genetic marker associated with gene
PT   that provides high dormancy to seeds.
XX
PS   Claim 9; SEQ ID NO 7; 13pp; Japanese.
XX
CC   The invention relates to a novel method for selecting highly-dormant
CC   wheat using a genetic marker associated with a gene that provides high
CC   dormancy to the seeds. In the method of the invention, the genetic marker
CC   exists specifically in the genetic region within 44 cM from the gene
CC   associated with high dormancy in chromosome 4A. The method is useful for
CC   selecting highly-dormant wheat. This polynucleotide sequence represents a
CC   wheat genetic marker of the invention.

PT   Genetic testing for systemic lupus erythematosus in human, by amplifying
PT   nucleic acids from tissue sample to obtain amplification products, and
PT   detecting presence or absence of dinucleotide repeat sequence in
PT   amplification products.
XX
PS   Claim 2; SEQ ID NO 7; 17pp; English.
XX
CC   The invention relates to a genetic testing method for diagnosing systemic
CC   lupus erythematosus (SLE) in human. The method involves amplifying
CC   nucleic acids from human tissue samples and detecting the presence or
CC   absence of variant alleles of a gene encoding poly(ADP-ribosyl)polymerase
CC   (PARP), which is a diagnostic of SLE or indication of a genetic
CC   predisposition for developing SLE. The method is useful for genetic
CC   testing for SLE in a human subject. It is useful in genetic counselling
CC   to provide useful information to persons considering their reproductive
CC   options. The present sequence is human PARP DNA 97-bp allelic fragment.
CC   This sequence is used to illustrate the method of the invention.

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 225; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
```

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 279; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT   Detecting a nucleotide repeat region in a nucleic acid having a
PT   particular length, useful for identifying nucleotide length polymorphism
PT   associated with a neurodegenerative disease, comprises using a ligase-
PT   assisted spacer addition assay.
XX
PS   Example 10; Page 55; 89pp; English.
XX
CC   The invention relates to a method of identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length, comprising employing ligase-assisted spacer addition
CC   (LASA) assay. The method is useful in the identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length. In particular, the method is useful for identification
CC   of a nucleotide length polymorphism in animals or humans, which is
CC   associated with a neurodegenerative disease including fragile X syndrome,
CC   Huntington's disease, or muscular dystrophy. Furthermore, the method may
CC   be used for identifying and/or typing microorganisms including yeasts and
CC   lower uni- and multi-cellular organisms, as well as prokaryotic
CC   microorganisms; and for genotyping subjects including humans. The method
CC   is also useful for detecting certain cancers and other malignancies.
CC   Moreover, the method can be used to provide markers for use in
CC   identification of human and non-human individuals, plants and
CC   microorganisms, to ascertain parentage of human or non-human individual,
CC   and to monitor responses to therapies including the possibility of
CC   nucleic acid damage. The nucleotide polymorphisms may be used in forensic
CC   science to identify a particular victim or an alleged perpetrator of a
CC   crime, in gene mapping and population studies. LASA may also be used in
CC   the manufacture of a kit for detecting and/or identifying nucleotide
CC   repeat regions such as a nucleotide length polymorphism in a eukaryotic
CC   genome. The LASA method avoids the time and cost required by prior art
CC   methods using gel electrophoresis and Southern transfer analysis. In
CC   particular, current diagnosis of Huntington's disease relies heavily upon
CC   the use of gel electrophoresis, a process that has proved difficult to
CC   automate or miniaturise. The LASA method allows total avoidance of this
CC   limiting step, making it a strong candidate for future use in clinical
CC   and laboratory procedures. ABK24276-ABK24313 represent primers used to
CC   detect polymorphisms or microsatellites as described in the method of the
CC   invention

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 11-12; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf58 which contains the repeat sequence having the
CC   formula: (CA)16.5. (Updated on 25-MAR-2003 to correct PF field.)

PT   Kit for diagnozing and treating T-cell associated diseases e.g.
PT   autoimmune, degenerative nervous system and infectious disease, comprises.
PT   nucleic acid primers specifically priming and allowing amplification of a
PT   Vbeta gene.
XX
PS   Disclosure; SEQ ID NO 711; 164pp; English.
XX
CC   The invention relates to a kit for diagnosing and treating T-cell
CC   associated diseases which comprises a panel of nucleic acid primers
CC   specifically priming and allowing amplification of each Vbeta gene,
CC   VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC   rejection and diagnosing and treating T-cell associated diseases
CC   including autoimmune diseases, degenerative nervous system diseases,
CC   graft versus host disease, hypersensitivity diseases, infectious diseases
CC   and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC   atrophic gastritis. Degenerative nervous system diseases include multiple
CC   sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC   I hypersensitivities such as contact with allergens that lead to
CC   allergies, Type II hypersensitivities such as those present in
CC   Goodpasture's syndrome and Type IV hypersensitivities such as those
CC   manifested in leprosy. Infectious diseases include viral infections
CC   caused by viruses such as HIV, fungal infections such as those caused by
CC   the yeast genus Candida, parasitic infections such as those caused by
CC   schistosomes, filaria and bacterial infections such as those caused by
CC   Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC   such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC   breast. The present sequence represents a Vbeta gene repeat sequence.

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 13-14; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf119 which contains the repeat sequence having the
CC   formula: (AC)16. (Updated on 25-MAR-2003 to correct PF field.)

XX
PS   Claim 9; Page 63; 104pp; English.
XX
CC   The present invention describes an isolated nucleotide sequence (I)
CC   encoding at least a portion of the human alpha-7 neuronal nicotinic
CC   acetylcholine receptor (alpha7-hnAChR). Also described are: (1) a peptide
CC   encoded by (I); (2) a vector comprising (I); (3) a host cell transformed
CC   with a vector of (2); (4) a polynucleotide comprising at least 15
CC   nucleotides which hybridises under stringent conditions to at least a
```

```
CC   portion of (I); (5) a method for detection of a polynucleotide encoding
CC   alpha 7-hnAChR in a biological sample; and (6) a method for amplification
CC   of nucleic acid from a sample suspected of containing nucleic acid
CC   encoding alpha 7-hnAChR. The primers and probes from the present
CC   invention can be used on brain tissue and blood samples of humans
CC   suspected of suffering from schizophrenia, small cell lung carcinoma,
CC   breast cancer and nicotine-dependent illness. This is particularly useful
CC   for diagnosis of schizophrenia. Other illnesses that can be
CC   studied/diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and
CC   Prader-Willi and Angelman's syndromes

PT   Isolation of satellite sequences from genomic DNA for use as DNA markers
PT   comprises isolating a library with high homogeneity by DNA fragmentation.
XX
PS   Example 5; Page 14; 35pp; Japanese.
XX
CC   The invention provides a novel method for isolation of satellite
CC   sequences from genomic DNA that comprises fragmentation of the DNA by a
CC   method which is not dependent on base sequences, then selection of the
CC   satellite sequences from the obtained genomic library of high
CC   homogeneity. The method is useful for the isolation of microsatellite DNA
CC   sequences which can be used as DNA markers. The new method markedly
CC   improves the efficiency of isolation of satellite sequences in comparison
CC   to prior art methods which are reliant on base sequences. Sequences
CC   AAZ98483-514 represent sequences from Haliotis discus, used in the method

PT   Detecting a nucleotide repeat region in a nucleic acid having a
PT   particular length, useful for identifying nucleotide length polymorphism
PT   associated with a neurodegenerative disease, comprises using a ligase-
PT   assisted spacer addition assay.
XX
PS   Example 10; Page 55; 89pp; English.
XX
CC   The invention relates to a method of identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length, comprising employing ligase-assisted spacer addition
CC   (LASA) assay. The method is useful in the identifying or detecting a
CC   nucleotide repeat region in a nucleic acid molecule characterised by a
CC   particular length. In particular, the method is useful for identification
CC   of a nucleotide length polymorphism in animals or humans, which is
CC   associated with a neurodegenerative disease including fragile X syndrome,
CC   Huntington's disease, or muscular dystrophy. Furthermore, the method may
CC   be used for identifying and/or typing microorganisms including yeasts and
CC   lower uni- and multi-cellular organisms, as well as prokaryotic
CC   microorganisms; and for genotyping subjects including humans. The method
CC   is also useful for detecting certain cancers and other malignancies.
CC   Moreover, the method can be used to provide markers for use in
CC   identification of human and non-human individuals, plants and
CC   microorganisms, to ascertain parentage of human or non-human individual,
CC   and to monitor responses to therapies including the possibility of
CC   nucleic acid damage. The nucleotide polymorphisms may be used in forensic
CC   science to identify a particular victim or an alleged perpetrator of a
CC   crime, in gene mapping and population studies. LASA may also be used in
CC   the manufacture of a kit for detecting and/or identifying nucleotide
CC   repeat regions such as a nucleotide length polymorphism in a eukaryotic
CC   genome. The LASA method avoids the time and cost required by prior art
CC   methods using gel electrophoresis and Southern transfer analysis. In
CC   particular, current diagnosis of Huntington's disease relies heavily upon
CC   the use of gel electrophoresis, a process that has proved difficult to
CC   automate or miniaturise. The LASA method allows total avoidance of this
CC   limiting step, making it a strong candidate for future use in clinical
CC   and laboratory procedures. ABK24276-ABK24313 represent primers used to

PT   Identifying individuals predisposed to schizophrenia, by providing
PT   nucleic acid comprising alpha7 allele from subject, detecting
PT   polymorphism within alpha7 allele, and correlating polymorphism with
PT   predisposition to schizophrenia.
XX
PS   Example 2; SEQ ID NO 10; 105pp; English.
XX
CC   The invention describes a method of identifying (M1) individuals
CC   predisposed to schizophrenia, involving providing a nucleic acid from a
CC   human subject, where the nucleic acid comprises an alpha7 allele,
CC   detecting the presence of a polymorphism within the alpha7 allele, and
CC   correlating the presence of the polymorphism with a predisposition to
CC   schizophrenia. Also described are: a kit for determining if a subject is
CC   predisposed to schizophrenia, comprising a reagent suitable for use in
CC   specifically detecting a polymorphism in an alpha7 allele, and
CC   instructions for determining whether a subject is predisposed to
CC   schizophrenia; and screening (M2) compounds, involving providing a cell
CC   comprising an alpha7 allele with the polymorphism, and one or more test
CC   compounds, contacting the cell with the test compound, and detecting a
CC   change in alpha7 expression in the cell in the presence of the test
CC   compound relative to the absence of the test compound. (M1) is useful for
CC   identifying individuals predisposed to schizophrenia. This sequence
CC   represents an oligonucleotide associated with the screening of human
CC   alpha 7 nicotinic ACh receptor polynucleotides.

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 236; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 11-12; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf79 which contains the repeat sequence having the
CC   formula: (AC)15.5. (Updated on 25-MAR-2003 to correct PF field.)

PT   Diagnosing single nucleotide polymorphism in human flt-1 gene, for
PT   assessing predisposition or susceptibility to diseases mediated by an flt
PT   -1 ligand, comprises determining the nucleic acid sequence at one or more
PT   point positions.
XX
PS   Example 1; Page 15; 30pp; English.
XX
CC   The invention relates to novel sequence and polymorphisms in the human
CC   flt-1 gene. Flt-1 is one of the two receptors for vascular endothelial
CC   growth factor (VEGFR-1). The invention also relates to a method for
CC   diagnosing one or more single nucleotide polymorphism (SNP) in human flt-
CC   1 gene. The method is useful for assessing the predisposition and/or
CC   susceptibility of an individual to diseases mediated by an flt-1 ligand,
CC   to recognise individuals who are particularly at risk from developing
CC   these conditions, and in the development of new drug therapies that
CC   selectively target one or more allelic variants of the flt-1 gene. Flt-1
CC   polymorphisms are used in the diagnosis and treatment of cancer and
CC   angiogenic diseases such as diabetic retinopathies, psoriasis, rheumatoid
CC   arthritis and endometriosis. Polymorphisms are also used in mapping the
CC   human genome and to elucidate the genetic component of the diseases, as
CC   genetic markers for this region in linkage studies. The nucleic acids are
CC   useful as components in databases useful in sequence identity, genome
CC   mapping, pharmacogenetics and other search analyses. The flt-1 antagonist
CC   is useful in the preparation of a medicament for treating VEGF-mediated
CC   diseases in a human diagnosed as having a single nucleotide polymorphism
CC   at one or more of the defined positions. The present DNA sequence is a
CC   PCR primer which is used for identifying human flt-1 gene polymorphism

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Example 8; Col 57-58; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The repeats, when
CC   analysed, fall into 4 categories: 1) perfect repeats which are
CC   alternating tandem CA repeats with no interruptions and without adjacent
CC   repeats of another sequence; 2) imperfect repeats which are defined as 2
CC   or more runs of uninterrupted CA repeats separated by no more than 3
CC   consecutive non-repeat bases; 3) compound perfect repeats which are
CC   uninterrupted runs of CA separated by no more than 3 consecutive non-
CC   repeat bases from a run of at least 5 uninterrupted dinucleotide or
CC   longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at
CC   least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats
CC   which are defined as for the perfect compound repeats except that the
CC   runs of CA are interrupted. This sequence is an example of an imperfect
CC   repeat sequence of structure: (CA)11CT(CA)4. (Updated on 25-MAR-2003 to
CC   correct PF field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 13-14; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf118 which contains the repeat sequence having the
CC   formula: (AC)15. (Updated on 25-MAR-2003 to correct PF field.)

PT   New simple sequence repeats having 2 or more tandemly repeated nucleotide
PT   core elements isolated from ryegrass and fescue, useful for selecting of
PT   genes in grass or cereal breeding or profiling grass or cereal species
PT   varieties.
XX
PS   Claim 13; Page 53; 72pp; English.
XX
CC   The invention relates to a substantially purified or isolated nucleic
CC   acid (I) from ryegrass or fescue species including a simple sequence
CC   repeat (SSR), having 2 or more tandemly repeated nucleotide core elements
CC   2-6 nucleotides in length. Also included are a nucleic acid primer
CC   suitable for amplifying an SSR, identifying (M1) an SSR by preparing a
CC   library of ryegrass or fescue genomic DNA enriched for SSRs and
CC   identifying clones in the library containing SSRs, a library of ryegrass
CC   or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for
CC   a gene in grass or cereal breeding by identifying an SSR that is closely
CC   associated with the gene such that the SSR and the gene are
CC   preferentially co-inherited, and selecting for the SSR in the breeding, a
CC   method for DNA profiling grass or cereal species varieties by assessing
CC   variation between SSR varieties and testing the purity of grass or cereal
CC   seed batches by assessing variation within seed batch of an SSR. The SSRs
CC   may be used in the selection of genes in grass or cereal breeding, for
CC   profiling grass or cereal species varieties, for testing the purity of
CC   grass or cereal seed batches, and for DNA profiling to establish the
CC   distinct identity, uniformity and/or stability of a cultivar. The present
CC   sequence is a ryegrass or fescue SSR

PT   Synthesis of branched polymers and novel branched polymeric structures -
PT   used as molecular probes esp. for detecting poly-nucleotide(s).
XX
PS   Example 9; Page 34; 52pp; English.
XX
CC   The sequences given in AAQ83939, AAQ83953 and AAQ83940 are used in the
CC   construction of an oligonucleotide clamp. The clamp is a comb-type
CC   branched polymer which has 5' termini and was used to bind a target
CC   sequence comprising a segment of the HIV pol and nef genes in single
CC   stranded or double stranded forms. An oligonucleotide clamp is a compound
CC   capable of forming a covalently closed macromolecule or a stable circular
CC   complex after specifically binding to the target polynucleotide.
CC   Oligonucleotide clamps generally comprise one or more oligonucleotide
CC   moieties capable of specific binding to the target molecule and one or
CC   more pairs of binding moieties covalently linked to the oligonucleotide
CC   moieties. Upon annealing of the oligonucleotides moieties to the target
CC   polynucleotide, the binding moieties of a pair are bought into
CC   juxtaposition so that they form a stable covalent or non-covalent linkage
CC   or complex. The interaction of the binding moieties effectively clamps
CC   the specifically annealed oligonucleotide moieties to the target
CC   polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 11-12; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf65 which contains the repeat sequence having the
CC   formula: (CA)14.5. (Updated on 25-MAR-2003 to correct PF field.)

XX
PS Example 9; Col 19-20; 20pp; English.
XX
CC The present invention relates to a method for synthesising a branched or
CC multiply connected macromolecular structure, comprising oligonucleotide
CC clamps (OC). The macromolecular structure is capable of specifically
CC binding to a target molecule, and can therefore be used as probes. At
CC least one OC comprises a target binding sequence that binds specifically
CC and stably with the target molecule, and at least two OCs comprise signal
CC generation moieties capable of generating a detectable signal in the
CC presence of the target molecule. In addition the OCs are connected to one
CC another by thioalkylamino, or thiophosphorylalkylamino bridges. The
CC present sequence is an OC used in the present invention

PT Producing sub-population of labeled nucleic acids, useful for analyzing
PT differences in RNA profiles between several different physiological
PT sources, using set of distinct gene specific primers.
XX
PS Example 3; SEQ ID NO 410; 11pp; English.
XX
CC The invention relates to producing a sub-population of labeled nucleic
CC acids (NAs) comprising contacting a NA sample from a physiological
CC source, with a pool of 50 distinct gene specific primers under suitable
CC conditions to enzymatically generate sub-population of NAs, where each
CC gene specific primer has a sequence complementary to a distinct mRNA, and
CC each labeled NA is generated using a single gene specific primer. The
CC method is useful for producing a sub-population of labeled NAs which is
CC useful for analysing the differences in the RNA profiles between several
CC different physiological sources, where the method comprises producing
CC subpopulation of labeled NAs for the different physiological sources,
CC comprising the populations for each physiological source to identify
CC differences in the population, where the comparison is preferably
CC performed by hybridising the labeled NAs for each of the distinct
CC physiological sources to an array of probe NAs stably associated with the
CC surface of a substrate to produce a hybridisation pattern for each of the
CC sources, and comparing the patterns for each of the sources, where
CC differential gene expression assays are utilised in differential
CC expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC tissue, or different tissue or subtissue types. The present sequence is a
CC human gene specific PCR primer used in the method of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from USPTO
CC at http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1

CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Example 9; Col 61-62; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The sequences AAT66084-
CC   T66107 represent repeat sequences of low informativeness found in
CC   specific human genes. This repeat sequence is found in the human
CC   chromosomal clone SW10. The sequence is amplified by primers AAT66103-4.

XX
PT   Inhibiting angiogenesis comprises administration of PPAR gamma ligands
PT   for treating tumors, neovascularization and rheumatoid arthritis.
XX
PS   Example 5; Page 31; 52pp; English.
XX
CC   Peroxisome proliferators are agents that induce peroxisomal
CC   proliferation. Peroxisome proliferator-activated receptors (PPARs) are
CC   members of the steroid receptor superfamily, and are ligand-activated
CC   transcription factors. There are three mammalian subtypes of PPAR, alpha,
CC   beta (also known as delta) and gamma. The present invention relates to
CC   inhibiting angiogenesis by contacting PPAR gamma with a PPAR gamma
CC   ligand. This method may be used to treat tumours, and diseases
CC   characterised by excessive neovascularisation e.g. rheumatoid arthritis,
CC   psoriasis, atherosclerosis, diabetes, retinopathy, retrolental
CC   fibroplasia, neovascular glaucoma, age-related macular degeneration,
CC   hemangiomas, thyroid hyperplasias, Grave's disease, tissue
CC   transplantation, chronic inflammation, lung inflammation, endometriosis
CC   and obesity. The present sequence is a probe for human Flt-1 gene. Flt-1
CC   is an endothelial cell tyrosine kinase receptor for vascular endothelial
CC   growth factor (VEGF) and has an important role in angiogenesis. The
CC   present sequence was used to determine whether PPARgamma activation leads
CC   to an alteration in Flt-1 gene expression and hence angiogenesis. An
CC   increase in Flt-1 levels was found after PPARgamma activation

PT   New simple sequence repeats having 2 or more tandemly repeated nucleotide
PT   core elements isolated from ryegrass and fescue, useful for selecting of
PT   genes in grass or cereal breeding or profiling grass or cereal species
PT   varieties.
XX
PS   Claim 6; Page 51; 72pp; English.
XX
CC   The invention relates to a substantially purified or isolated nucleic
CC   acid (I) from ryegrass or fescue species including a simple sequence
CC   repeat (SSR), having 2 or more tandemly repeated nucleotide core elements
CC   2-6 nucleotides in length. Also included are a nucleic acid primer
CC   suitable for amplifying an SSR, identifying (M1) an SSR by preparing a
CC   library of ryegrass or fescue genomic DNA enriched for SSRs and
CC   identifying clones in the library containing SSRs, a library of ryegrass
CC   or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for
CC   a gene in grass or cereal breeding by identifying an SSR that is closely
CC   associated with the gene such that the SSR and the gene are
CC   preferentially co-inherited, and selecting for the SSR in the breeding, a
CC   method for DNA profiling grass or cereal species varieties by assessing
CC   variation between SSR varieties and testing the purity of grass or cereal
CC   seed batches by assessing variation within seed batch of an SSR. The SSRs
CC   may be used in the selection of genes in grass or cereal breeding, for
CC   profiling grass or cereal species varieties, for testing the purity of
CC   grass or cereal seed batches, and for DNA profiling to establish the
CC   distinct identity, uniformity and/or stability of a cultivar. The present
CC   sequence is a ryegrass or fescue SSR

PT   Diagnosing single nucleotide polymorphism in human flt-1 gene, for
PT   assessing predisposition or susceptibility to diseases mediated by an flt
PT   -1 ligand, comprises determining the nucleic acid sequence at one or more
PT   point positions.
XX
PS   Example 1; Page 16; 30pp; English.
XX
CC   The invention relates to novel sequence and polymorphisms in the human
CC   flt-1 gene. Flt-1 is one of the two receptors for vascular endothelial
CC   growth factor (VEGFR-1). The invention also relates to a method for
CC   diagnosing one or more single nucleotide polymorphism (SNP) in human flt-
CC   1 gene. The method is useful for assessing the predisposition and/or
CC   susceptibility of an individual to diseases mediated by an flt-1 ligand,
CC   to recognise individuals who are particularly at risk from developing
CC   these conditions, and in the development of new drug therapies that
CC   selectively target one or more allelic variants of the flt-1 gene. Flt-1
CC   polymorphisms are used in the diagnosis and treatment of cancer and
CC   angiogenic diseases such as diabetic retinopathies, psoriasis, rheumatoid
CC   arthritis and endometriosis. Polymorphisms are also used in mapping the
CC   human genome and to elucidate the genetic component of the diseases, as
CC   genetic markers for this region in linkage studies. The nucleic acids are
CC   useful as components in databases useful in sequence identity, genome
CC   mapping, pharmacogenetics and other search analyses. The flt-1 antagonist
CC   is useful in the preparation of a medicament for treating VEGF-mediated
CC   diseases in a human diagnosed as having a single nucleotide polymorphism
CC   at one or more of the defined positions. The present DNA sequence is a
CC   PCR primer which is used for amplifying human flt-1 gene

PT   Diagnosing single nucleotide polymorphism in human flt-1 gene, for
PT   assessing predisposition or susceptibility to diseases mediated by an flt
PT   -1 ligand, comprises determining the nucleic acid sequence at one or more
PT   point positions.
XX
PS   Claim 11; Page 4; 30pp; English.
XX
CC   The invention relates to novel sequence and polymorphisms in the human
CC   flt-1 gene. Flt-1 is one of the two receptors for vascular endothelial
CC   growth factor (VEGFR-1). The invention also relates to a method for
CC   diagnosing one or more single nucleotide polymorphism (SNP) in human flt-
CC   1 gene. The method is useful for assessing the predisposition and/or
CC   susceptibility of an individual to diseases mediated by an flt-1 ligand,
CC   to recognise individuals who are particularly at risk from developing
CC   these conditions, and in the development of new drug therapies that
CC   selectively target one or more allelic variants of the flt-1 gene. Flt-1
CC   polymorphisms are used in the diagnosis and treatment of cancer and
CC   angiogenic diseases such as diabetic retinopathies, psoriasis, rheumatoid
CC   arthritis and endometriosis. Polymorphisms are also used in mapping the
CC   human genome and to elucidate the genetic component of the diseases, as
CC   genetic markers for this region in linkage studies. The nucleic acids are
CC   useful as components in databases useful in sequence identity, genome
CC   mapping, pharmacogenetics and other search analyses. The flt-1 antagonist
CC   is useful in the preparation of a medicament for treating VEGF-mediated
CC   diseases in a human diagnosed as having a single nucleotide polymorphism
CC   at one or more of the defined positions. The present DNA sequence is a
CC   allele specific nucleotide probe which is used for detecting human flt-1
CC   gene polymorphism

PT   Kit for diagnozing and treating T-cell associated diseases e.g.
PT   autoimmune, degenerative nervous system and infectious disease, comprises
PT   nucleic acid primers specifically priming and allowing amplification of a
PT   Vbeta gene.
XX
PS   Disclosure; SEQ ID NO 665; 164pp; English.
XX
CC   The invention relates to a kit for diagnosing and treating T-cell
CC   associated diseases which comprises a panel of nucleic acid primers
CC   specifically priming and allowing amplification of each Vbeta gene,
CC   VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC   rejection and diagnosing and treating T-cell associated diseases
CC   including autoimmune diseases, degenerative nervous system diseases,
CC   graft versus host disease, hypersensitivity diseases, infectious diseases
CC   and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC   atrophic gastritis. Degenerative nervous system diseases include multiple
CC   sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC   I hypersensitivities such as contact with allergens that lead to
CC   allergies, Type II hypersensitivities such as those present in
CC   Goodpasture's syndrome and Type IV hypersensitivities such as those
CC   manifested in leprosy. Infectious diseases include viral infections
CC   caused by viruses such as HIV, fungal infections such as those caused by
CC   the yeast genus Candida, parasitic infections such as those caused by
CC   schistosomes, filaria and bacterial infections such as those caused by
CC   Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC   such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC   breast. The present sequence represents a Vbeta gene repeat sequence.

PT   Isolation of satellite sequences from genomic DNA for use as DNA markers
PT   comprises isolating a library with high homogeneity by DNA fragmentation.
XX
PS   Example 5; Page 14; 35pp; Japanese.
XX
CC   The invention provides a novel method for isolation of satellite
CC   sequences from genomic DNA that comprises fragmentation of the DNA by a
CC   method which is not dependent on base sequences, then selection of the
CC   satellite sequences from the obtained genomic library of high
CC   homogeneity. The method is useful for the isolation of microsatellite DNA
CC   sequences which can be used as DNA markers. The new method markedly
CC   improves the efficiency of isolation of satellite sequences in comparison
CC   to prior art methods which are reliant on base sequences. Sequences
CC   AAZ98483-514 represent sequences from Haliotis discus, used in the method
CC   of the invention

XX
PS   Example 7; Page 33; 52pp; English.
XX
CC   This sequence represents an oligonucleotide clamp which was used to bind
CC   a target sequence comprising a segment of the HIV pol and nef genes in
CC   single stranded or double stranded forms. This molecule forms a loop-and-
CC   branch comfigurartion. An oligonucleotide clamp is a compound capable of
CC   forming a covalently closed macromolecule or a stable circular complex
CC   after specifically binding to the target polynucleotide. Oligonucleotide
CC   clamps generally comprise one or more oligonucleotide moieties capable of
CC   specific binding to the target molecule and one or more pairs of binding
CC   moieties covalently linked to the oligonucleotide moieties. Upon
CC   annealing of the oligonucleotides moieties to the target polynucleotide,
CC   the binding moieties of a pair are bought into juxtaposition so that they
CC   form a stable covalent or non-covalent linkage or complex. The
CC   interaction of the binding moieties effectively clamps the specifically
CC   annealed oligonucleotide moieties to the target polynucleotide. (Updated
CC   on 25-MAR-2003 to correct PN field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 1; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf31 which contains the repeat sequence having the
CC   formula: (AC)13A. (Updated on 25-MAR-2003 to correct PF field.)

PT   Synergistic compositions comprising hyaluronic acid and Mycobacterium
PT   phlei DNA and cell walls, useful for treating cancers.
```

```
XX
PS   Example 7; Page 23; 27pp; English.
XX
CC   The invention relates to compositions for the treatment of cancers,
CC   comprising purified hyaluronic acid (HA) and a second antineoplastic
CC   agent such as Mycobacterium phlei DNA, a Mycobacterium phlei DNA/cell
CC   wall complex, a cytotoxic chemotherapeutic drug or a synthetic
CC   antineoplastic oligonucleotide. On its own, HA stimulates the production
CC   of the cytokines interleukin-6 (IL-6) and IL-12 by immune system cells.
CC   In combination, HA and the second antineoplastic agent of the composition
CC   act synergistically to potentiate each other's ability to inhibit
CC   proliferation and induce apoptosis in cancer cells. Due to the synergy
CC   between the HA and the second antineoplastic agent, a reduced standard
CC   dose of the second antineoplastic agent can be used without compromising
CC   the therapeutic effectiveness of the cancer treatment. The reduction in
CC   dose helps to reduce adverse side-effects and the development of drug
CC   resistance or immunosensitisation, thereby improving the quality of life
CC   for the patient. In addition, as HA is inexpensive and as most
CC   chemotherapeutic drugs are expensive, the combined use of HA and a
CC   chemotherapeutic drug can significantly reduce the cost of cancer
CC   treatment. The increase in dose effectiveness, decrease in toxicity and
CC   decrease in cost address provide important benefits for mammals,
CC   including humans. The present sequence represents a synthetic
CC   antineoplastic oligonucleotide which was used in a composition with HA in
CC   an exemplification of the invention

CC   The present invention relates to a method for synthesising a branched or
CC   multiply connected macromolecular structure, comprising oligonucleotide
CC   clamps (OC). The macromolecular structure is capable of specifically
CC   binding to a target molecule, and can therefore be used as probes. At
CC   least one OC comprises a target binding sequence that binds specifically
CC   and stably with the target molecule, and at least two OCs comprise signal
CC   generation moieties capable of generating a detectable signal in the
CC   presence of the target molecule. In addition the OCs are connected to one
CC   another by thioalkylamino, or thiophosphorylalkylamino bridges. The
CC   present sequence is an OC used in the present invention

PT   Producing sub-population of labeled nucleic acids, useful for analyzing
PT   differences in RNA profiles between several different physiological
PT   sources, using set of distinct gene specific primers.
XX
PS   Example 3; SEQ ID NO 409; 11pp; English.
XX
CC   The invention relates to producing a sub-population of labeled nucleic
CC   acids (NAs) comprising contacting a NA sample from a physiological
CC   source, with a pool of 50 distinct gene specific primers under suitable
CC   conditions to enzymatically generate sub-population of NAs, where each
CC   gene specific primer has a sequence complementary to a distinct mRNA, and
CC   each labeled NA is generated using a single gene specific primer. The
CC   method is useful for producing a sub-population of labeled NAs which is
CC   useful for analysing the differences in the RNA profiles between several
CC   different physiological sources, where the method comprises producing
CC   subpopulation of labeled NAs for the different physiological sources,
CC   comprising the populations for each physiological source to identify
CC   differences in the population, where the comparison is preferably
CC   performed by hybridising the labeled NAs for each of the distinct
CC   physiological sources to an array of probe NAs stably associated with the
CC   surface of a substrate to produce a hybridisation pattern for each of the
CC   sources, and comparing the patterns for each of the sources, where
CC   differential gene expression assays are utilised in differential
CC   expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC   tissue, or different tissue or subtissue types. The present sequence is a
CC   human gene specific PCR primer used in the method of the invention. Note:
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from USPTO
CC   at http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1

PT   Kit for diagnozing and treating T-cell associated diseases e.g.
PT   autoimmune, degenerative nervous system and infectious disease, comprises
PT   nucleic acid primers specifically priming and allowing amplification of a
PT   Vbeta gene.
XX
PS   Disclosure; SEQ ID NO 770; 164pp; English.
XX
CC   The invention relates to a kit for diagnosing and treating T-cell
CC   associated diseases which comprises a panel of nucleic acid primers
CC   specifically priming and allowing amplification of each Vbeta gene,
CC   VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC   rejection and diagnosing and treating T-cell associated diseases
CC   including autoimmune diseases, degenerative nervous system diseases,
CC   graft versus host disease, hypersensitivity diseases, infectious diseases
CC   and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC   atrophic gastritis. Degenerative nervous system diseases include multiple
CC   sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC   I hypersensitivities such as contact with allergens that lead to
CC   allergies, Type II hypersensitivities such as those present in
CC   Goodpasture's syndrome and Type IV hypersensitivities such as those
CC   manifested in leprosy. Infectious diseases include viral infections
CC   caused by viruses such as HIV, fungal infections such as those caused by
CC   the yeast genus Candida, parasitic infections such as those caused by
CC   schistosomes, filaria and bacterial infections such as those caused by
CC   Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC   such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC   breast. The present sequence represents a Vbeta gene repeat sequence.

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Example 8; Col 57-58; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The repeats, when
CC   analysed, fall into 4 categories: 1) perfect repeats which are
CC   alternating tandem CA repeats with no interruptions and without adjacent
CC   repeats of another sequence; 2) imperfect repeats which are defined as 2
CC   or more runs of uninterrupted CA repeats separated by no more than 3
CC   consecutive non-repeat bases; 3) compound perfect repeats which are
CC   uninterrupted runs of CA separated by no more than 3 consecutive non-
CC   repeat bases from a run of at least 5 uninterrupted dinucleotide or
CC   longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at
CC   least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats
CC   which are defined as for the perfect compound repeats except that the
CC   runs of CA are interrupted. This sequence is an example of an imperfect
CC   repeat sequence of structure: (CA)5G(ACA)G(AC)7A. (Updated on 25-MAR-2003

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 360; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Isolation of satellite sequences from genomic DNA for use as DNA markers
PT   comprises isolating a library with high homogeneity by DNA fragmentation.
XX
PS   Example 5; Page 14; 35pp; Japanese.
XX
CC   The invention provides a novel method for isolation of satellite
CC   sequences from genomic DNA that comprises fragmentation of the DNA by a
CC   method which is not dependent on base sequences, then selection of the
CC   satellite sequences from the obtained genomic library of high
CC   homogeneity. The method is useful for the isolation of microsatellite DNA
CC   sequences which can be used as DNA markers. The new method markedly
CC   improves the efficiency of isolation of satellite sequences in comparison
CC   to prior art methods which are reliant on base sequences. Sequences
CC   AAZ98483-514 represent sequences from Haliotis discus, used in the method
CC   of the invention

PT   vascular endothelial growth factor receptor-1, useful for diagnosing or
PT   treating cancer, rheumatoid arthritis, or diseases or conditions
PT   involving angiogenesis.
XX
PS   Example 13; Page 79; 150pp; English.
XX
CC   The present invention describes a compound (C) 8-50 nucleobases in length
CC   targeted to a nucleic acid molecule encoding vascular endothelial growth
CC   factor receptor-1 (VEGFR-1), where the compound inhibits the expression
CC   of VEGFR-1 and specifically hybridises with the nucleic acid encoding
CC   VEGFR-1 or with an 8-nucleobase portion of an active site on the nucleic
CC   acid molecule encoding VEGFR-1. Also described: (1) a composition
CC   comprising (C) and a carrier or diluent; (2) inhibiting the expression of
CC   VEGFR-1 in cells or tissues by contacting the cells or tissues with (C)
CC   so that the expression of VEGFR-1 is inhibited; and (3) treating an
CC   animal having a disease or condition associated with VEGFR-1 by
CC   administering (C) to the animal so that the expression of VEGFR-1 is
CC   inhibited. (C) has antiangiogenic, antirheumatic, antiarthritic,
CC   cytostatic and antiinflammatory activities, and can be used in antisense
CC   gene therapy. The antisense compounds are useful for modulating the
CC   expression of VEGFR-1 and for treating diseases or conditions associated
CC   with the expression of VEGFR-1, such as hyperproliferative disorders
CC   (e.g. cancer), rheumatoid arthritis, or diseases or conditions involving
CC   angiogenesis. The antisense compounds are also useful for diagnostics,
CC   therapeutics, prophylaxis, e.g. to prevent or delay infection,
CC   inflammation or tumour formation, as research reagents and kits, and in
CC   distinguishing between functions of various members of a biological
CC   pathway. The present sequence represents a PCR primer for human VEGFR-1,
CC   which is used in an example from the present invention. Human VEGFR-1 is
CC   located from chromosome 13q12

PT   Typing genes that contain polymorphic microsatellite loci, useful for
PT   identifying predisposition to disease, by amplification and determining
PT   length of amplicons.
XX
PS   Example 3; Page 27; 64pp; German.
XX
CC   The invention describes a method of typing (M1) a gene (I) that has one
CC   or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC   amplification of at least one DNA region of (I) that includes PML, using
CC   as template a DNA sample containing at least one segment of (I); and
CC   determining the length of the resulting amplicon(s). Also described are:
CC   a method of determining (M2) microsatellite markers (MM) for
CC   predisposition to a disease, associated with a gene that includes one or
CC   more PML; and prediagnosis (M3) of diseases associated with gene that
CC   include PML. The method is used to identify microsatellite markers, in a
CC   disease-related gene, that are associated with a predisposition to
CC   diseases and for prediagnosis of such diseases, especially prion diseases
CC   but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC   metabolic diseases; also to type genes that encode milk proteins,
CC   hormones or transcription factors. The method is simpler, quicker and
CC   particularly less expensive than known methods based on sequencing. This
CC   sequence represents a primer used to genotype a region of the cow prion
CC   protein (PrP) comprising a polymorphic microsatellite locus.

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 9-10; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The inserts from the clones were amplified
CC   by primers AAT65798-T66047. Those clones where the repeat sequence has
CC   been determined are shown in AAT65704-797. This repeat sequence is from
CC   the marker clone Mdf32 which contains the repeat sequence having the
CC   formula: (AC)12A. (Updated on 25-MAR-2003 to correct PF field.)

PT   immunoglobulin like domain from flt-1 or KDR receptor, useful to inhibit
PT   cell proliferation and angiogenesis.
XX
PS   Example 1; Page 40; 62pp; English.
XX
CC   This sequence represents a primer for flt-1 which is used in the chimeric
CC   factor of the invention. The factor is a chimeric vascular endothelial
CC   growth factor (VEGF) receptor capable of binding and inhibiting VEGF,
CC   which comprises: (a) immunoglobulin (Ig) like domains 1, 2 and 3 of the
CC   flt-1 and/or KDR receptor; or (b) extracellular domain of the FLT4
CC   receptor, in which Ig like domain 2 is replaced by Ig like domain 2 of
CC   the flt-1 or KDR receptor, where 1 or more other Ig like domains of the
CC   FLT4 receptor are, or are not replaced by the corresponding Ig like
CC   domain of the flt-1 or KDR receptor. Host cells containing DNA encoding
CC   the chimeric factor can be used for the recombinant production of the
CC   chimeric VEGF receptor, which can be used to inhibit VEGF activity, e.g.
CC   endothelial cell proliferation and angiogenesis, in mammals. The chimeric
CC   VEGF receptor can be used to treat conditions associated with undesired
CC   angiogenesis, specifically a wide range of malignant tumours, but also
CC   retinopathy, rheumatoid arthritis, psoriasis, neovascular glaucoma,
CC   thyroid hypertrophy and lung inflammation

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 55; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

XX
CC The sequences given in ABQ80256-69 are primers which were used to
CC identify the presence of vascular endothelial growth factor (VEGF), or
CC the VEGF receptors, Flk1, FLT-1 and FLT-4 in human stem cells (HSC). The
CC method of the invention for alleviating or reducing a symptom of a
CC disease or disorder of the nervous system comprises administering
CC platelet-derived growth factor (PDGF), vascular endothelial growth factor
CC (VEGF), a combination of PDGF and VEGF, or a PDGF or VEGF agonist, to a
CC patient in order to modulate neural stem cell or neural progenitor cell
CC activity in vivo. The method is useful for alleviating or reducing the
CC symptoms of a disease or disorder of the nervous system, e.g.
CC neurodegenerative disorders, neural stem cell disorders, neural
CC progenitor disorders, ischaemic disorders, neurological traumas,
CC affective disorders, neuropsychiatric disorders or learning and memory
CC disorders. In particular, the method is useful for alleviating or
CC treating Parkinson's disease and disorders, Huntington's disease,
CC Alzheimer's disease, Amyotrophic Lateral Sclerosis, spinal ischaemia,
CC ischaemic stroke, spinal cord injury or cancer-related brain/ spinal cord
CC injury, schizophrenia and öther psychoses, depression, bipolar
CC depression/disorder, anxiety syndromes/disorders, phobias, stress and
CC related syndromes, cognitive function disorders, aggression, drug and
CC alcohol abuse, obsessive compulsive behaviour syndromes, seasonal mood
CC disorder, borderline personality disorder, cerebral palsy, life style
CC drug, multi-infarct dementia, Lewy body dementia, age related/geriatric
CC dementia, epilepsy and injury related to epilepsy, spinal cord injury,
CC brain injury, trauma related brain/spinal cord injury, anti-cancer
CC treatment related brain/spinal cord tissue injury, infection and
CC inflammation related brain/spinal cord injury, environmental toxin
CC related brain/spinal cord injury, multiple sclerosis, autism, attention
CC deficit disorders, narcolepsy or sleep disorders. The PDGF and/or VEGF,
CC is useful in the manufacture of a medicament for alleviating or treating
CC these diseases or disorders, accelerating growth of neural stem cells or
CC neural progenitor cells, or inducing proliferation or differentiation of
CC these cells. This primer gives an estimated band size of 470 bp

PT   Depletion of transplantation antigens in donor cells - using anti-sense
PT   or triplex-forming oligonucleotide(s), used for treating auto-immune
PT   disease and in transplants.
XX
PS   Example; Page 22; 71pp; English.
XX
CC   The sequences given in AAQ47176-77 represent triplex forming oligo-
CC   nucleotides which bind to the mRNA sequence of the MHC class II locus DR
CC   A structural gene at positions 851-876. The sequences given in AAQ47178-
CC   80 represent control oligomers which contain base compositions similar to
CC   that around this DR A region but not containing the correct sequences. DR
CC   A is a transplantation antigen. Binding of this sequence to the DR A gene
CC   inhibits antigen production. This method may be used for treating
CC   individuals with autoimmune disease, characterised by dysfunctional
CC   expression of a transplantation antigen. It may also be used to produce
CC   cells which are more easily transplanted into a recipient. (Updated on 25
CC   -MAR-2003 to correct PN field.)

PT   Diagnosing single nucleotide polymorphism in human flt-1 gene, for
PT   assessing predisposition or susceptibility to diseases mediated by an flt
PT   -1 ligand, comprises determining the nucleic acid sequence at one or more
PT   point positions.
XX
PS   Claim 11; Page 4; 30pp; English.
XX
CC   The invention relates to novel sequence and polymorphisms in the human
CC   flt-1 gene. Flt-1 is one of the two receptors for vascular endothelial
CC   growth factor (VEGFR-1). The invention also relates to a method for
```

```
CC   diagnosing one or more single nucleotide polymorphism (SNP) in human flt-
CC   1 gene. The method is useful for assessing the predisposition and/or
CC   susceptibility of an individual to diseases mediated by an flt-1 ligand,
CC   to recognise individuals who are particularly at risk from developing
CC   these conditions, and in the development of new drug therapies that
CC   selectively target one or more allelic variants of the flt-1 gene. Flt-1
CC   polymorphisms are used in the diagnosis and treatment of cancer and
CC   angiogenic diseases such as diabetic retinopathies, psoriasis, rheumatoid
CC   arthritis and endometriosis. Polymorphisms are also used in mapping the
CC   human genome and to elucidate the genetic component of the diseases, as
CC   genetic markers for this region in linkage studies. The nucleic acids are
CC   useful as components in databases useful in sequence identity, genome
CC   mapping, pharmacogenetics and other search analyses. The flt-1 antagonist
CC   is useful in the preparation of a medicament for treating VEGF-mediated
CC   diseases in a human diagnosed as having a single nucleotide polymorphism
CC   at one or more of the defined positions. The present DNA sequence is a
CC   allele specific nucleotide probe which is used for detecting human flt-1
CC   gene polymorphism

PT   New nucleic acid encoding a chimeric cell surface protein, useful for
PT   treating cancer, inflammation, autoimmune disease or psoriasis.
XX
PS   Example 2; Page 40; 78pp; English.
XX
CC   This sequence represents a PCR primer, used to create the coding sequence
CC   for a chimeric protein of the invention. The chimeric proteins comprise:
CC   (a) an extra-cellular domain which binds multivalent ligand
CC   preferentially at the surface of a target cell relative to a non-target
CC   cell; (b) a membrane spanning domain; and (c) a cytoplasmic domain which
CC   induces cell death in a target cell upon binding of the extra-cellular
CC   domain with the multivalent ligand. The DNA and protein are useful for
CC   inducing apoptosis in a target cell in vitro. The sequences are useful
CC   for treating cancer, inflammation, autoimmune disease or psoriasis

PT   Polymorphic bovine DNA markers - used in genetic identification, gene
PT   mapping, and selective breeding.
XX
PS   Table 7; Page 324; 517pp; English.
XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n.>9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

XX
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Example 9; Col 61-62; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. The sequences AAT66084-
CC   T66107 represent repeat sequences of low informativeness found in
CC   specific human genes. This repeat sequence is found in the human
CC   chromosomal clone JW42. The sequence is amplified by primers AAT66097-8.

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Claim 101; Page 59; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT Modulating angiogenesis and/or apoptosis for preventing or treating
PT cancer, myocardial infarction and promoting healing, by modulating the
PT activity of vascular endothelial growth factor-modulated gene
PT polypeptide.
XX
PS Example 2; Page 103; 155pp; English.
XX
CC The invention relates to modulating angiogenesis and cell survival that
CC involves modulating the activity of at least one vascular endothelial
CC growth factor (VEGF)-modulated gene polypeptide. The method is useful for
CC modulating angiogenesis and cell survival, for treating tumour and cancer
CC by decreasing angiogenesis in cancerous tumours and treating myocardial
CC infarction and promoting healing, by increasing angiogenesis. Transgenic
CC non-human animals, having disrupted arginine-rich protein (ARP), are
CC useful for determining the clinical stage of ovarian tumorous, which is
CC useful for determining if the tumour has potential for metastasis. ARP is
CC useful in gene therapy and in diagnostic applications. VEGFmg proteins
CC are useful in the treatment of tumours, neoplasias, hemangiomas,
CC rheumatoid arthritis, atherosclerosis, idiopathic pulmonary fibrosis,
CC vascular restenosis, arteriovenous malformations, meningioma, neovascular
CC glaucoma, psoriasis, hemophilic joints, hypertrophic scars, Osler-Weber
CC syndrome, scleroderma, vascular adhesion pathologies, synovitis,
CC dermatitis, endometriosis, diabetic retinopathy, neovascularization
CC associated with corneal injury or grafts, wound, sore, and ulcer healing.

PT Novel antisense oligonucleotides useful for inhibiting vascular
PT endothelial growth factor expression, angiogenesis and for treating
PT cancer, e.g., Kaposi's sarcoma, ovarian cancer and prostrate cancer.
XX
PS Example 12; Page 56; 105pp; English.
XX
CC The invention provides a composition comprising one or more antisense
CC oligonucleotides directed against vascular endothelial growth factor
CC (VEGF) where the antisense oligonucleotides inhibits proliferation of
CC cells exhibiting autocrine VEGF activity at an IC_5_0 concentration of
CC between 0.5-2.5 micro Ma. The antisense oligonucleotides may be directed
CC against VEGF for inhibiting cancer cell proliferation and angiogenesis.
CC Preferably the oligonucleotide AAH23032 (a modified version of AAH22984)
CC is used and may be utilized to treat Kaposi's sarcoma, ovarian cancer,
CC prostrate cancer, pancreatic cancer or melanoma. Sequences AAH23012-023
CC represent gene-specific primers used in RT-PCR amplification of VEGF
CC receptors

PT   Inhibiting angiogenesis in a subject, involves administering at least one
PT   antiangiogenic nucleic acid molecule to the subject.
XX
PS   Claim 2; Page 38; 276pp; English.
XX
CC   The invention relates to inhibiting angiogenesis in a subject, comprising
CC   administering at least one antiangiogenic nucleic acid molecule. Also
CC   included is a kit comprising a first container housing the antiangiogenic
CC   nucleic acids, and instructions for administering them to a subject
CC   having a condition characterised by unwanted angiogenesis. The method is
CC   useful for inhibiting angiogenesis associated with solid tumour growth,
CC   tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC   diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC   corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
CC   rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
CC   neovascularisation, telangiectasia, haemophiliac joints, angiofibroma,
CC   wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
CC   hypertrophic scars. The present sequence is an antiangiogenic nucleic
CC   acid of the invention

PT   Typing genes that contain polymorphic microsatellite loci, useful for
PT   identifying predisposition to disease, by amplification and determining
PT   length of amplicons.
XX
PS   Example 3; Page 30; 64pp; German.
XX
CC   The invention describes a method of typing (M1) a gene (I) that has one
CC   or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC   amplification of at least one DNA region of (I) that includes PML, using
CC   as template a DNA sample containing at least one segment of (I); and
CC   determining the length of the resulting amplicon(s). Also described are:
CC   a method of determining (M2) microsatellite markers (MM) for
CC   predisposition to a disease, associated with a gene that includes one or
CC   more PML; and prediagnosis (M3) of diseases associated with gene that
CC   include PML. The method is used to identify microsatellite markers, in a
CC   disease-related gene, that are associated with a predisposition to
CC   diseases and for prediagnosis of such diseases, especially prion diseases
CC   but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC   metabolic diseases; also to type genes that encode milk proteins,
CC   hormones or transcription factors. The method is simpler, quicker and
CC   particularly less expensive than known methods based on sequencing. This
CC   sequence represents a primer used to genotype a region of the sheep prion
CC   protein (PrP) comprising a polymorphic microsatellite locus.

CC   The invention describes a method of typing (M1) a gene (I) that has one
CC   or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC   amplification of at least one DNA region of (I) that includes PML, using
CC   as template a DNA sample containing at least one segment of (I); and
CC   determining the length of the resulting amplicon(s). Also described are:
CC   a method of determining (M2) microsatellite markers (MM) for
CC   predisposition to a disease, associated with a gene that includes one or
CC   more PML; and prediagnosis (M3) of diseases associated with gene that
CC   include PML. The method is used to identify microsatellite markers, in a
CC   disease-related gene, that are associated with a predisposition to
CC   diseases and for prediagnosis of such diseases, especially prion diseases
CC   but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC   metabolic diseases; also to type genes that encode milk proteins,
CC   hormones or transcription factors. The method is simpler, quicker and
CC   particularly less expensive than known methods based on sequencing. This
CC   sequence represents a primer used to genotype a region of the cow prion
CC   protein (PrP) comprising a polymorphic microsatellite locus.

PT   Genetic testing for systemic lupus erythematosus in human, by amplifying
PT   nucleic acids from tissue sample to obtain amplification products, and
PT   detecting presence or absence of dinucleotide repeat sequence in
PT   amplification products.
XX
PS   Claim 1; SEQ ID NO 6; 17pp; English.
XX
CC   The invention relates to a genetic testing method for diagnosing systemic
CC   lupus erythematosus (SLE) in human. The method involves amplifying
CC   nucleic acids from human tissue samples and detecting the presence or
CC   absence of variant alleles of a gene encoding poly(ADP-ribosyl)polymerase
CC   (PARP), which is a diagnostic of SLE or indication of a genetic
CC   predisposition for developing SLE. The method is useful for genetic
CC   testing for SLE in a human subject. It is useful in genetic counselling
CC   to provide useful information to persons considering their reproductive
CC   options. The present sequence is human PARP DNA 85-bp allelic fragment.
CC   This sequence is used to illustrate the method of the invention.

PT   Predicting if a subject responds to epidermal growth factor receptor
PT   (EGFR) inhibitor treatment, useful for cancer patients, by determining
PT   expression level of prognostic RNA transcripts of genes e.g. FUS, or its
PT   expression product.
XX
PS   Claim 41; SEQ ID NO 112; 77pp; English.
XX
CC   The invention comprises a method for predicting the likelihood that a
CC   subject will respond to cancer treatment with an epidermal growth factor
CC   receptor (EGFR) inhibitor. The method involves determining the expression
CC   level of one or more prognostic RNA transcripts or their expression
CC   products in a biological sample comprising cancer cells obtained from the
CC   patient. The method of the invention is useful for predicting whether a
CC   patient is likely to respond well to treatment with an EGFR inhibitor,
CC   especially patients having: ovarian cancer, colon cancer, pancreatic
CC   cancer, non-small cell lung cancer, breast cancer, and head/neck cancer.
CC   The present DNA sequence represents a probe which is specific for a
CC   prognostic marker of the invention.

PT   New angiogenic peptides, useful for promoting angiogenesis in a tissue of
PT   a subject suffering from arteriosclerosis, retinopathy, remodeling
PT   disorder, von Hippel-Lindau syndrome, diabetes and/or hereditary
PT   hemorrhagic telangiectasia.
XX
PS   Example 3; SEQ ID NO 22; 114pp; English.
XX
CC   The invention relates to angiogenic peptides given as SEQ ID Nos. 2, 4,
CC   6, 8, 10 or 12 in the specification. Also described are: (i) a
CC   composition-of-matter comprising at least two peptides, each
CC   independently selected from those cited above, (ii) a pharmaceutical
CC   composition comprising a therapeutically effective amount of any of the
CC   peptides cited above, or a peptide having an amino acid sequence of SEQ
CC   ID No. 13 or 32 as given in the specification, the peptide being at least
CC   6 and no more than 50 amino acid residues in length, (iii) a method of
CC   promoting angiogenesis in a tissue of a subject comprising providing to
CC   the subject, a therapeutically effective amount of the peptide cited
CC   above, (iv) a nucleic acid construct comprising a polynucleotide sequence
CC   encoding any of the peptides cited above, (v) a composition for targeting
CC   a drug to endothelial cells, the composition comprising the drug fused to
CC   any of the peptides cited above, and (vi) a method of identifying
CC   putative angiogenic molecules comprising providing endothelial cells
CC   having peptides bound to it, each of the peptides is selected as above,
CC   and identifying a molecule capable of displacing the peptides from the
CC   endothelial cells, to thus identify putative angiogenic molecules. The
CC   peptides of the invention are useful for promoting angiogenesis in a
CC   tissue of a subject suffering from arteriosclerosis, retinopathy,
CC   remodeling disorder, von Hippel-Lindau syndrome, diabetes and/or
CC   hereditary hemorrhagic telangiectasia. This sequence represents a PCR
CC   primer used to amplify human fms-related tyrosine kinase 1 (FLT-1) cDNA
CC   in the examples of the present invention.

PT   New multifunctional siNA molecule comprising a structure having Formula
PT   MF-III, useful for treating a respiratory disease selected from asthma,
PT   COPD, and allergic rhinitis.
XX
PS   Example 13; SEQ ID NO 2707; 266pp; English.
XX
CC   The invention comprises short interfering nucleic acid (siNA) molecules
CC   which modulate vascular endothelial growth factor (VEGF) or VEGF receptor
CC   (VEGFR) gene expression. The siNA molecules of the invention are useful
CC   for treating respiratory diseases (e.g. asthma, COPD, and allergic
CC   rhinitis). The present RNA sequence represents a target region for a
CC   VEGFR-specific siRNA.

PT   Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor
PT   to augment T-helper1 cells like immune activation and to treat non-
PT   allergic inflammatory diseases, e.g. psoriasis and Crohn's disease.
XX
PS   Disclosure; SEQ ID NO 1012; 58pp; English.
XX
CC   The present invention relates to a method for augmenting T-helper 1 cells
CC   (Th1)-like immune activation in a subject. The method comprises
CC   administrating an immunostimulatory nucleic acid (I) to induce Th1-like
CC   immune activation; and administrating a cyclooxygenase inhibitor (II) to
CC   inhibit prostaglandin expression, is new. The present sequence is one
CC   such immunostimulatory nucleic acid. (I) is useful for treating non-
CC   allergic inflammatory diseases such as psoriasis, inflammatory bowel
CC   diseases (Crohn's disease and ulcerative colitis), eczema, allergic
CC   contact dermatitis or latex dermatitis.

XX
CC   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC   primer extension (SNPE) primers, and the sequences of regions flanking
CC   sites of single nucleotide polymorphisms SNPs. The present invention
CC   includes kits for determining the presence or absence of a SNP, using the
CC   oligonucleotides of the invention. The PCR primers are used to amplify a
CC   SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC   The oligonucleotides are useful for genotyping a nucleic acid sample by
CC   performing a single-nucleotide primer extension reaction. The
CC   oligonucleotides are useful for determining the presence, absence or
CC   identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC   assess by association analysis the genotype of an individual or group of
CC   individuals, having a pathological phenotypic trait suspected of being
CC   caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC   osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC   traits also include symptoms of or susceptibility to multifactorial
CC   disease of which a component is or may be genetic such as autoimmune
CC   diseases, including, rheumatoid arthritis, multiple sclerosis,
CC   inflammation, cancer, nervous system diseases and infection by pathogenic
CC   microorganism. The method is also useful in forensic investigations and
CC   paternity analysis. The present sequence represents a single nucleotide
CC   primer extension (SNPE) primer specific for a human SNP containing DNA
CC   sequence

PT Promoting liver growth or promoting hepatocyte proliferation in liver of
PT subject, treating pathological liver condition e.g. cirrhosis in subject,
PT by administering vascular endothelial growth factor receptor modulator.
XX
PS Example 4; Page 44; 64pp; English.
XX
CC The present invention describes a method for promoting (M1) liver growth
CC or promoting (M2) hepatocyte proliferation in the liver of a subject,
CC treating (M3) a pathological liver condition in a subject, or protecting
CC (M4) liver from damage in the subject due to exposure to a hepatotoxic
CC agent, which involves administering to the subject a vascular endothelial
CC growth factor receptor (VEGFR) modulating agent (I). Also described: (1)
CC an article of manufacture comprising a container, composition contained
CC within the container and a label on the container instructing uses of the
CC composition for promoting liver growth, where the composition comprises a
CC VEGFR modulating agent in the amount effective to promote liver growth;
